Memory, the encoding, storage, and retrieval in the human mind of past experiences. The fact that experiences influence subsequent behaviour is evidence of an obvious but nevertheless remarkable activity called remembering. Memory is both a result of and an influence on perception, attention, and learning. The basic pattern of remembering consists of attention to an event followed by the representation of that event in the brain.

Memory (Stanford Encyclopedia of Philosophy)

Memory loss is usually described as forgetfulness or amnesia. Memory is often understood as an informational processing system with explicit and implicit functioning that is made up of a sensory processor, short-term (or working) memory, and long-term memory. This can be related to the neuron. The sensory processor allows information from the outside world to be sensed in the form of chemical and physical stimuli and attended to various levels of focus and intent.
