Example #16: Specific Energy and Channel Transitions • Trapezoidal channel with  $b = 8$  ft,  $z = 2$ ,  $n = 0.030$ . Normal depth occurs upstream and downstream. • Rectangular culvert ( $b = 5$  ft,  $n = 0.012$ ) added with concrete apron extending 10 feet downstream from culvert outlet. • Develop flow profile, especially downstream of

Solution We are to discuss the driving force in open-channel flow and how flow rate is determined. Analysis Flow in a channel is driven naturally by gravity. Water flow in a river, for example, is driven by the elevation difference between the source and the sink. The flow rate in an open channel is established by the dynamic

### Chapter 13 OPEN-CHANNEL FLOW

Artificial open channels are the channels develops by men. They are usually designed with regular geometric shapes. Example: Irrigation canals, laboratory flumes, spillway chutes, drops, culverts, roadside gutters, etc.

#### Types of Open Channel - Civil Engineering

Open channel flow can be said to be as the flow of fluid (water) over the deep hollow surface (channel) with the cover of atmosphere on the top. Examples of open channels flow are river, streams, flumes, sewers, ditches and lakes etc. we can be said to be as open channel is a way for flow of fluid having pressure equal to the atmospheric pressure.

Classification of Open-Channel Flows Open-channel flows are characterized by the presence of a liquid-gasinterface called the free surface.  $p=p$  atm Natural flows : rivers, creeks, floods, etc. Human-made systems : fresh-water aquaducts, irrigation, sewers, drainage ditches, etc.

#### OPEN-CHANNEL FLOW

For example, large open channel flow (e.g., large rivers) can be approximated as steady flow for time periods in which the flow changes are not significant. The principal methods of discharge measurement described below assume steady flow conditions, but in most natural systems, steady flow is only present for short time periods.

Demonstration of Concepts Given: A hydraulic jump occurs in a v-shaped channel with an upstream depth equal to 2 ft. The flow through the channel is 100 ft<sup>3</sup>/s and the side slopes of the channel are 2:1 (m=2). Find the downstream depth. Solution: Check that momentum is conserved There is a slight differences between these...
